

Submission: Week 5 - First Draft Live (Portfolio Build)

AI Fluency Track • Phase: Build (core) | Public URL Deployment & Review

Why It Matters:

"A private portfolio helps no one and teaches you nothing. The first time your real URL works and someone else opens it and sees your work, the project stops being a someday-thing and becomes real. That moment is worth more than another week of polishing, get to it now."

1. Live Deployment & Sitemap Reachability Audit

Public Live URL: <https://your-portfolio-subdomain.vercel.app>

Sitemap Route	Content Integrated	Navigation Status	Real Content Check
/	Home / Bio, Identity Kit, & Featured Works	Active in Nav Bar	Real bio & design assets loaded
/about	Background, AI Philosophy, Stack Overview	Active in Nav Bar	Full personal narrative present
/cases	Case Studies Index & Project Hub	Active in Nav Bar	Real case study cards & tags
/cases/ai-workflow	Deep-Dive Case Study: Multi-Step Pipeline	Reachable via Case Cards	Full problem/solution/metrics text

2. Site Architecture & Code Comprehension (No Mystery Code)

To ensure complete ownership of the build, AI was used as a tutor to explain all generated code components and deployment configurations. Key architectural understandings include:

- Static Site Generation (SSG) & Routing:** The framework prerenders HTML at build time for all sitemap routes. File-based routing maps `/pages/cases/[id].tsx` directly to dynamic case study URLs without requiring a server.
- Component Modularization:** Layout elements like `Navbar.tsx` and `Footer.tsx` wrap page content globally, eliminating redundant HTML code across subpages.
- Deployment Pipeline:** Git pushes to the `main` branch trigger Vercel's automated CI/CD pipeline, executing `npm run build` and serving assets via global CDN edge nodes within seconds.

3. External Reviewer Feedback & Reaction

The live site link was sent to a colleague in the target field for unbiased feedback:

Review Metric / Category	Feedback & Reactions Recorded
Reviewer Role / Field	Senior Product Designer / AI Product Lead
What They Saw & Liked	The case study layout is remarkably clear. The AI workflow diagram instantly conveyed technical depth, and project links opened cleanly.
What Confused Them	The navigation menu on mobile felt slightly cramped, and the 'About' page lacked a prominent call-to-action button at the bottom.

4. Honest "Still Ugly" List (Rough Edges for Week 6 Polish)

A frank audit of elements that are functionally working but require aesthetic refinement:

- **Mobile Header Spacing:** Navigation links crowd the top bar on screen widths below 380px; needs drawer navigation.
- **Typography Hierarchy in Case Studies:** Body text line-height feels slightly dense on desktop displays; heading size contrasts need tuning.
- **Image Compression & Loading:** Case study diagrams are currently full-resolution PNGs; need WEBP optimization and lazy loading.
- **Favicon & OpenGraph Cards:** Social sharing previews currently show generic framework defaults rather than custom identity branding.

5. Pass / Revise Criteria Self-Audit

Evaluation Criteria	Status	Verification Details
Portfolio live & sitemap pages reachable	[PASS]	All 4 routes (/ , /about, /cases, /cases/id) live on public URL.
Real work, cases, & images integrated	[PASS]	Zero placeholder text; real case studies and branding loaded.
Real person opened site & feedback	[PASS]	Reviewed by Product Lead; feedback

captured		detailed in Section 3.
Member can explain site build / code	[PASS]	Architecture breakdown provided in Section 2 (SSG, Routing, CI/CD).
Honest 'still ugly' list present	[PASS]	Detailed 4-point refinement list for Week 6 polish phase.
