

Portfolio Visual Curation & Image Discernment Report

FlyRank AI Internship — Week 03 Deliverable: Curate Your Images

1. Curation Strategy & Image Mapping

In accordance with the FlyRank curation principles, AI generation was strictly limited to connective visual tissue (hero textures and iconography). All proof of work for the U-DRIVE project relies on real, un-rendered production screenshots, while personal representation relies exclusively on an authentic headshot.

Asset Name	Image Type	Source / Call	Strategic Purpose & Justification
U-DRIVE Hero & Product Grid	Work Proof	REAL CAPTURE	Actual Next.js/React production UI showing the dark pink theme, dynamic car cards, and filter bar.
Cart Context & State Flow	Technical Proof	REAL CAPTURE	Crisp, cropped VS Code screenshot showing the React Context API implementation for state management.
Form Validation Error State	Interactive Proof	REAL CAPTURE	Real browser capture displaying client-side form validation messages on phone number and email fields.
Author Headshot	Personal Identity	REAL PHOTO	Authentic portrait photo establishing personal credibility. AI avatars/generations strictly avoided.
Hero Subtitle Background	Connective Tissue	AI GENERATED	A subtle, dark magenta-to-plum blurred mesh texture matching #800040 and #111827 to frame heading copy.

2. Real Captures vs. AI Generation Calls

• **Real Capture Call for Project Work:** AI-generated UI mockups look polished but lack engineering authenticity—they cannot show real React state behavior, Next.js routing, or DOM rendering. I chose a crisp, high-resolution desktop screenshot of U-DRIVE running in localhost/Vercel. This proves the React component hierarchy and dynamic filtering actually work.

- **Real Photo Call for Personal Identity:** An AI-generated persona portrait destroys trust instantly. Using a real, professionally framed photograph establishes human authenticity and accountability, fulfilling the core requirement that the subject of the creator must be genuine.

3. AI Discernment & Rejection Log (The Keepers vs. Rejections)

For the hero background texture, multiple iterations were generated to hold visual style steady with the Identity Kit (#800040 dark pink, #111827 near-black). Below are the critical discernment notes detailing what was rejected and why:

✗ Rejected Generation #1: Highly Detailed 3D Metallic Car Render

- Prompt Used: 'A sleek 3D futuristic supercar rendering with dark pink studio neon lighting.'
- Reason for Rejection: The image was too visually loud and competed directly with the UI screenshots. A heavy 3D car render made the portfolio feel like a video game promo rather than a serious frontend developer's case study. It violated the brief's requirement that 'your work should be the loudest thing on the page.'

✗ Rejected Generation #2: High-Contrast Neon Cyberpunk Wave Pattern

- Prompt Used: 'Abstract abstract geometric pink and black neon wave background.'
- Reason for Rejection: The generated accent color drifted into neon magenta (#FF007F) instead of our deep dark plum (#800040), and the high contrast geometric lines created severe visual clutter behind the typography, reducing hero heading legibility.

☑ The Keeper Generation: Subtle Matte Bokeh & Ambient Gradient

- Final Iterated Prompt: 'Minimal matte abstract gradient texture, smooth transition between dark plum (#800040) and near-black (#111827), soft ambient depth, low contrast, no hard shapes, professional editorial studio mood.'
- Selection Rationale: Perfectly holds the visual style steady with the Identity Kit without stealing attention from the actual U-DRIVE project proof.
