

AI-Assisted CS Developer Portfolio Foundation

Student: Nusaiba Rafiq Surovi | Track: AI-Assisted CS Developer

Combined Submissions: FL-01 & FL-02

PART I: FL-01 — What Are You Proving?

1. One-Paragraph Proof Statement

I am Nusaiba Rafiq Surovi, a Computer Science student and AI-assisted developer. I build clean, fully documented, and tested Python backend codebases leveraging systematic AI-prompting and auditing workflows. I am building this portfolio specifically for an Engineering Manager or Tech Lead at a fast-growing startup who needs an agile junior developer capable of shipping features rapidly without sacrificing code quality. The single, ultimate action I want them to take after reviewing my GitHub repositories is to book a 15-minute technical discovery call with me.

2. The One Honest Line "Why"

"My LinkedIn and CV can list 'Python' and 'AI tools' as static keywords, but they cannot prove my actual workflow—the exact prompt histories, code audits, and Git commits that demonstrate how I systematically write and clean production-ready code with AI."

PART II: FL-02 — Portfolio Sitemap and Project Prep

1. Proof & Claim Strategy

As a Computer Science student, my ultimate proof of capability resides directly within my **GitHub repositories**. Instead of creating a bloated website, my goal is to build a hyper-focused, minimal portfolio designed to transition recruiters and collaborators from curiosity to belief as quickly as possible.

2. Digital Portfolio Sitemap Diagram

1. Home Page / Hero Section

Claim: AI-assisted developer delivering clean, documented codebases fast.

Action: [View Selected Work] CTA button.

Figure 1: Digitally constructed minimal sitemap and conversion funnel from landing to contact action.

3. Claude Project Setup & Custom Instructions

Figure 2: Screenshot of Claude.ai showing Custom Instructions customized for Nusaiba's portfolio and tutor requirements.

4. First Prompt: Pressure-Testing Results

Prompt Submitted to Claude:

"I only have a GitHub profile to prove my coding skills. Here is my minimal sitemap:

- 1. Home Page (Hero claim: 'AI-assisted developer delivering clean, documented codebases fast')*
- 2. Selected Work (Direct GitHub repository cards with quick descriptions)*
- 3. About Me (CS student background, VS Code + AI workflow)*
- 4. Contact (Direct link to LinkedIn, GitHub, Email)*

Please pressure-test this sitemap. How should I structure my GitHub repositories so that a recruiter visiting my minimal portfolio believes my claim instantly? What is one critical thing I need to change in my sitemap?"

Claude's Analysis & Feedback Summary:

- **The README Dilemma:** Simply linking to GitHub is lazy. Recruiter screens take 6 seconds; they won't click multiple directories to assess my code quality. My repositories must have world-class visual, structured README markdown files outlining 'What I built', 'My AI Prompt Strategy', and 'How I audited the code'.
- **Hero Claim Critique:** Saying 'delivering clean, documented codebases fast' is abstract. Better to make it concrete: 'CS student building tested, audited codebases powered by structured AI pipelines.'
- **Friction Elimination:** Having a completely separate page for 'Selected Work' adds an unnecessary click. Instead, the 'Selected Work' and 'About Me' should be sections on a single, seamless landing page, leading directly to the single target action: Booking/Contacting.

My Actionable Change (Tweak):

Actionable Decision: Based on Claude's pressure-test, I am collapsing my 4-page sitemap into a single-page scrolling application. I will feature my 3 core GitHub projects directly on the Home page. Most importantly, I will change the 'Selected Work' listings so that every project links to a highly organized, professional README.md that details my specific VS Code + AI prompt workflow, showing recruiters exactly how I co-authored and audited the codebase.
