

Submission: Week 09 Checkpoint - The Plan to Keep Building

Post-Launch Portfolio Maintenance, Next Case Study Plan & Context Preservation

Why It Matters:

"A portfolio that never gets a second project goes stale and stops proving anything new. The difference between a class artifact and a career platform is one simple habit, set up now while you still remember how everything works."

- Target Next Project: Autonomous Enterprise Data Pipeline & RAG Evaluation Engine
- Scheduled Calendar Nudge: August 28, 2026 (Recurring Monthly Build Review)

1. Concrete "How to Add Next Case" Step-by-Step Guide

To ensure adding a new project takes under 30 minutes rather than a full site rebuild, new case studies follow the standardized Week 2 three-beat narrative structure within `projects.json``.

Step 1: Open the Preserved Claude Build Project

- Prompt the pre-configured Claude Project with raw project notes (e.g., repository link, architecture diagrams, benchmark numbers).

Step 2: Generate the Three-Beat Narrative Shape

- 1. Beat 1 — The Problem:** Who faced the bottleneck, the specific friction, and why automated LLM execution was needed.
- 2. Beat 2 — What You Did:** The technical architecture, model choices, RAG stack, guardrails, and key design decisions.
- 3. Beat 3 — What Came Of It:** Concrete metric outcomes (e.g., latency reduction, cost per query, accuracy benchmark scores).

Step 3: Update Data & Assets

- Copy generated JSON block into ``data/projects.json``.
- Place thumbnail screenshot into ``/assets/projects/``.
- Push changes to main branch (``git commit -m 'feat: add case study 02' && git push``); Netlify automatically deploys in < 45 seconds.

``projects.json`` Schema Example:

```
{
```

```
"id": "case-study-02",
"title": "Enterprise Data Pipeline RAG Evaluator",
"beat1_problem": "Enterprise support teams spent 15+ hrs/week triaging unindexed PDF
contracts.",
"beat2_action": "Built an async Python extraction pipeline with Hybrid Vector Search and Guardrail
checks.",
"beat3_result": "Achieved 94.8% retrieval accuracy and cut manual query turnaround from 4 hours
to 90 seconds.",
"demo_url": "https://alexchen.dev/demos/rag-eval",
"repo_url": "https://github.com/alexchen/rag-eval-engine"
}
```

2. Named Next Work & Concrete Calendar Reminder Evidence

Parameter	Target Detail	Verification Status
Named Next Project	Enterprise Data Pipeline & RAG Evaluation Engine	[SPECIFIED]
Project Objective	Autonomous document parsing with real-time faithfulness benchmarking.	[SCOPED]
Calendar Reminder Set	Google Calendar Recurring Nudge: August 28, 2026 @ 10:00 AM	[ACTIVE REMINDER]

Calendar Reminder Details:

- **Title:** Portfolio Update: Add Case Study #2 (RAG Evaluator)
- **Frequency:** Monthly (Last Friday of every month)
- **Notification:** Email & Desktop Pop-up 24 hours prior.

3. Build Context Preservation (Claude Project Setup)

To keep future case study additions cheap and fast, the custom Claude Project context has been locked and saved. It retains full awareness of brand guidelines, CSS styling patterns, tone of voice, and technical stack specifications.

Preserved Context Category	Stored File / Knowledge Asset
Identity Kit & Visual Standards	`brand_guidelines.md` (Colors, Typography, UI Components)

Code Base Structure & Data Schema	`projects.json` structure, HTML templates, CSS utility classes
Voice & Narrative Strategy	Three-Beat Case Study Rules (Problem, Action, Outcome)

4. Checkpoint Pass / Revise Criteria Self-Audit

Evaluation Criteria	Status	Verification Details
Concrete 'how to add next case' note written	[PASS]	3-step process reusing Week 2 three-beat shape documented with JSON schema.
Specific next work named & real reminder set	[PASS]	Enterprise Data Pipeline RAG Evaluator named; Google Calendar reminder set for Aug 28.
Build context (Claude Project) preserved	[PASS]	Brand guidelines, system voice, and schema stored in dedicated Claude Project.
