

# FL-01: Workflow Audit and AI Toolkit Setup

Course: AI Fluency: Framework & Foundations (Anthropic Academy)

## 1. Workflow Audit Table

This audit captures my recurring weekly activities as a CS student and developer. Each task is classified according to Ethan Mollick's task-classification framework to optimize cognitive bandwidth and systematically identify where AI adds true leverage vs. where it degrades quality.

| # | Recurring Weekly Task                              | Classification             | Rationale & Actionable Logic                                                                                 |
|---|----------------------------------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------|
| 1 | Writing core logic & complex algorithms in VS Code | Just me                    | Requires deep conceptual reasoning, personal ownership, and AI is prone to subtle logic hallucinations here. |
| 2 | Debugging syntax errors & reading long error logs  | Delegate to AI with review | Claude scans stack traces and fixes syntax typos in seconds, saving hours of manual searching.               |
| 3 | Refactoring and modularizing legacy/messy code     | Collaborate with AI        | I direct the architectural changes while Claude handles the tedious rewriting and documentation updates.     |
| 4 | Writing unit tests for newly developed features    | Delegate to AI with review | AI is excellent at generating test coverage cases, though I must verify edge-case assertions manually.       |
| 5 | Drafting emails & project updates for team members | Delegate to AI with review | Claude structures my rough bullet points into professional, clear updates which I review before sending.     |
| 6 | Brainstorming system designs & API structures      | Collaborate with AI        | It serves as an interactive sounding board to bounce ideas off and explore different schema options.         |
| 7 | Learning fundamental complex math/CS theories      | Just me                    | Shortcut learning defeats the purpose of education; deep understanding must happen in my own brain first.    |
| 8 | Writing comprehensive project README documentation | Fully automate             | Once given code context, AI writes perfect markdown documentation,                                           |

|    |                                                    |                     |                                                                                                                |
|----|----------------------------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------|
|    |                                                    |                     | requiring almost no structural changes.                                                                        |
| 9  | Formatting JSON/database seed data                 | Fully automate      | A highly repetitive, structured task that AI executes instantly and flawlessly using regex or simple scripts.  |
| 10 | Personal journaling and daily habit reflection     | Just me             | An inherently human, reflective practice where introducing AI would ruin the authenticity and emotional value. |
| 11 | Planning my weekly study & project sprint schedule | Collaborate with AI | I input my hard deadlines and energy levels, and AI suggests a balanced distribution of tasks to tweak.        |
| 12 | Sorting and labeling incoming bug reports/tickets  | Fully automate      | Simple keyword and intent classification rules can be completely automated using structured AI APIs.           |

## 2. AI Toolkit & Academy Setup

My workspace configuration has been completed, including enrollment in the Anthropic Academy's *AI Fluency: Framework & Foundations* course and custom project parameters configured within Claude.ai to establish persona, rules, and workflows.

### Workspace Configuration & Proof of Setup

Fig : Custom Instructions configured in Claude.ai showing my profile persona, preferred communication tone, and AI integration goals

Fig : Anthropic Academy dashboard confirming successful enrollment and completion of the "AI Fluency: Framework & Foundations" course.

### 3. Target Tasks & Success Definitions

The following three tasks are selected from the audit table to be systematically optimized and practiced in assignments FL-02 through FL-04. Each has a measurable success standard defining what 'done well' means.

#### Target Task 1: Debugging Syntax Errors & Parsing Error Logs

- **Success Definition (Done Well):** The time taken to identify and resolve compile/runtime errors drops by 50% compared to my manual search baseline. The AI-suggested bug fixes apply without creating side-effect errors, and I can successfully explain the underlying logical failure to a peer based on the AI's explanation.

#### Target Task 2: Code Refactoring & Modularization

- **Success Definition (Done Well):** Refactoring results in highly readable, modularized code that reduces Cyclomatic Complexity by at least 20%. The code must pass all pre-existing and newly written unit tests, and structural updates are delivered by Claude in structured diffs that require minimal manual line-by-line correction.

#### Target Task 3: Automated Documentation & README Generation

- **Success Definition (Done Well):** The output markdown documentation is 100% complete, accurately representing all endpoints/functions, setup processes, and configuration parameters. Reviewing and editing the generated document takes under 5 minutes, resulting in a production-ready file that an external developer can immediately use to run the project.
